

Flow Paths

A **Flow Path** is a **defined route** through the Site that can be used to filter the results or produce a Profile view. The current collection of Flow Paths for the Site is shown under the Paths node on the Tree View.

Creating a Flow Path

A Flow Path is created by right-clicking on the 'Paths' node in the Tree View and selecting 'Add' or by clicking 'Add Flow Path' on the Build ribbon. This will put the Plan View into Path creation mode. Then click on the icon of the first element you wish to include and then walk down the required route clicking on each element in turn.

It is also possible to specify a path by selecting the icon of first element and then the icon of the last element you are interested in. If there is only one route through the network to reach the end location a path will be created including all the elements in between. However, if there is a point at which the path could go to two or more different elements, the elements will be selected up to this point ready for you to select the next element in the unique path through the network. If, on the other hand, the path goes through a single sequence of elements but in doing so has a choice of one or more parallel connections between two elements, then a radial menu will appear allowing the user to select which connection of a set of parallel connections they wish the path to traverse. This process will continue for each set of parallel connections (if any) along the path.

As soon as the first element on the path is clicked on a new 'Flow Path' node is added to the 'Flow Paths' top-level node in the Tree View. Double clicking on a 'Flow Path' node will produce the Profile form. Right mouse clicking on a 'Flow Path' node will produce a menu that provides options to edit, rename, duplicate or delete the Flow Path, as well as view it in the Profile form.

Pipe Sizing

A Flow Path is used by the [Pipe Sizing Criteria](#) to define a path for sizing.

Viewing a Profile

To view the Profile for a given Path either double-click on the Path in the Tree View or right-click and choose 'View Path'. Or select the Profile under Profiles on the View ribbon tab.

Workflow - What's next...?

Connect Inflows to your **Stormwater Control**, specify **Inlets** or **Outlets** or connect to another Stormwater Control or **Junction**.
