

Notify Affected Customers

The Notify Affected Customers function can be used to help locate those properties that will be directly or indirectly effected by the flushing operations. If an active layer is available that contains a graphic location and links to customer name, parcel number, address or some other link to the customer, the **Not**

ify Affected Customers  button will locate the customers involved. The customers can then be notified of the flushing events to take place.

The Notify Affected Customers command will:

- Identify and notify the residents/addresses effected by the UDF programs.
- Notify customers close to an active flush zone or sequence.
- Specify an affected buffer radius.
